Abstract

Twenty seven species of *Psathyrella* have been found in Northeast China. Amongst them, *P. conica*, *P. jilinensis*, *P. mycenoides* and *P. subsingeri* are described as new species, based on studying morphological characteristics and phylogenetic analyses. Detailed morphological descriptions, line drawings and photographs of the new species are presented. Phylogenetic analysis of the nuclear ribosomal internal transcribed spacer (ITS) region and an identification key to the 27 *Psathyrella* species occurring in Northeast China are provided.

Keywords

Basidiomycete, new taxon, phylogenetic analysis, taxonomy

Introduction

Psathyrella (Fr.) Quél. is one of the large genera of Agaricales Underw. which consists of 1,030 records in Index Fungorum (<http://www.indexfungorum.org>), comprising approximately 500 species (Smith 1972; Kits van Waveren 1985; Örstadius and Kundsén 2012;). It is characteristic of fragile basidiomata, hygrophanous pileus, brown to

black brown spore print, always present cheilocystidia and basidiospores smooth or rarely granulose or with myxosporium, fading to greyish in concentrated sulphuric acid (H_2SO_4).

The studies of this genus mainly focused on Europe and North America in recent years (Romagnesi 1952; Smith 1972; Kits van Waveren 1985; Nagy et al. 2011; Örstadius and Kundsén 2012; Örstadius et al. 2015). In China, 51 names (*Psathyrella* s.l.) were reported, including four new species (Chiu 1973; Bi et al. 1985; Bi et al. 1987; Bi 1991; Wang and Bau 2014). Amongst them, 21 species can be found in Northeast China which includes Helongjiang Province, Jinlin Province, Liaoning Province and the northeast of Inner Mongolia Autonomous Region (Wang 2014).

Due to the morphological plasticity of the *Psathyrella*, some species cannot be distinguished clearly and many names have been combined (Örstadius and Kundsén 2012). Therefore, the aim of this study is to clarify the diversity of *Psathyrella* in Northeast China by traditional taxonomy and molecular phylogenetic analysis. The examined specimens (from 1997 to 2017) are deposited in the Herbarium of Mycology, Jilin Agricultural University (HMJAU). As a result of morphological and molecular observations, 27 species of *Psathyrella* were identified, and of which *P. conica*, *P. jilinensis*, *P. mycenoides* and *P. subsingeri* were reported as new species. Molecular phylogenetic affinities of the 27 species based on the nuclear ribosomal internal transcribed spacer (ITS) region and an identification key to them are provided.

Materials and methods

Morphological studies

Specimens are deposited in the Herbarium of Mycology, Jilin Agricultural University (HMJAU). Macroscopic characteristics were recorded from fresh specimens. Colour codes are from Kornerup and Wanscher (1978). Samples for microscopic examination were mounted in water and 5% aqueous KOH. Amyloid reactions were diagnosed in Melzer's reagent. Thirty basidiospores, cystidia and basidia were measured for each collection. The basidiospores quotient ($Q=L/B$) was calculated from measurements of basidiospores.

DNA extraction and sequencing

The NuClean Plant Genomic DNA kit (CWBIO) was employed for DNA extraction and PCR amplification from dried specimens. PCR was performed using a touchdown programme (Yan and Bau 2017) and the ITS region was amplified with the primer pair ITS1 and ITS4 (White et al. 1990). The details of sequenced specimens are given in Table 1. The DNA sequencing was done by Comate Bioscience Co., Ltd., Changcun City, China.

Table 1. Sequenced specimens used in phylogenetic analysis.

Data analyses

ITS1+5.8S+ITS2 sequences of 27 species were tested with BLAST in GenBank. Fifty five sequences were downloaded from GenBank, including 21 type species of *Psathyrella*, based on BLAST results and referred to the recent studies (Nagy et al. 2013; von Bonsdorff et al. 2014; Örstadius et al. 2015; Yan and Bau 2017). A total of 103 ITS sequences were aligned using MAFFT 7.205 (Kato and Standley 2013). The aligned ITS dataset consisted of 643 nucleotide sites (including gaps). The best model (GTR+I+G) was selected by AIC in MRMODELTEST 2.3 (Nylander 2004). Bayesian Inference (BI) was performed with MRBAYES 3.2.6 and four Markov Chains (MCMC) were run for three million generations, sampling every 300th generation. The first 25% trees were discarded (Ronquist and Huelsenbeck 2003). Maximum likelihood analysis was performed with IQTREE 1.5.6 (Nguyen et al. 2014).

Results

The phylogenetic tree (Figure 1) shows that all studied materials fall into *Psathyrella*, with a high statistical support value (BPP=1). It is divided into 14 clades. Most of them have a high statistical support value (BPP≥0.95, Bootstrap≥75), except /fibrillosa I and /fibrillosa II. Four new species are separated into individual lineages (BPP=1, Bootstrap=100) and are independent from the close taxa. *Psathyrella conica* forms a distinct lineage in /fibrillosa II; *P. jilinensis* belongs to /fibrillosa II and groups together with *P. borealis*; *P. mycenoides* belongs to /prona and is closely related to *P. lilliputana* Örstadius & E. Larss.; and *P. subsingeri* forms a distinct lineage in /candolleana.

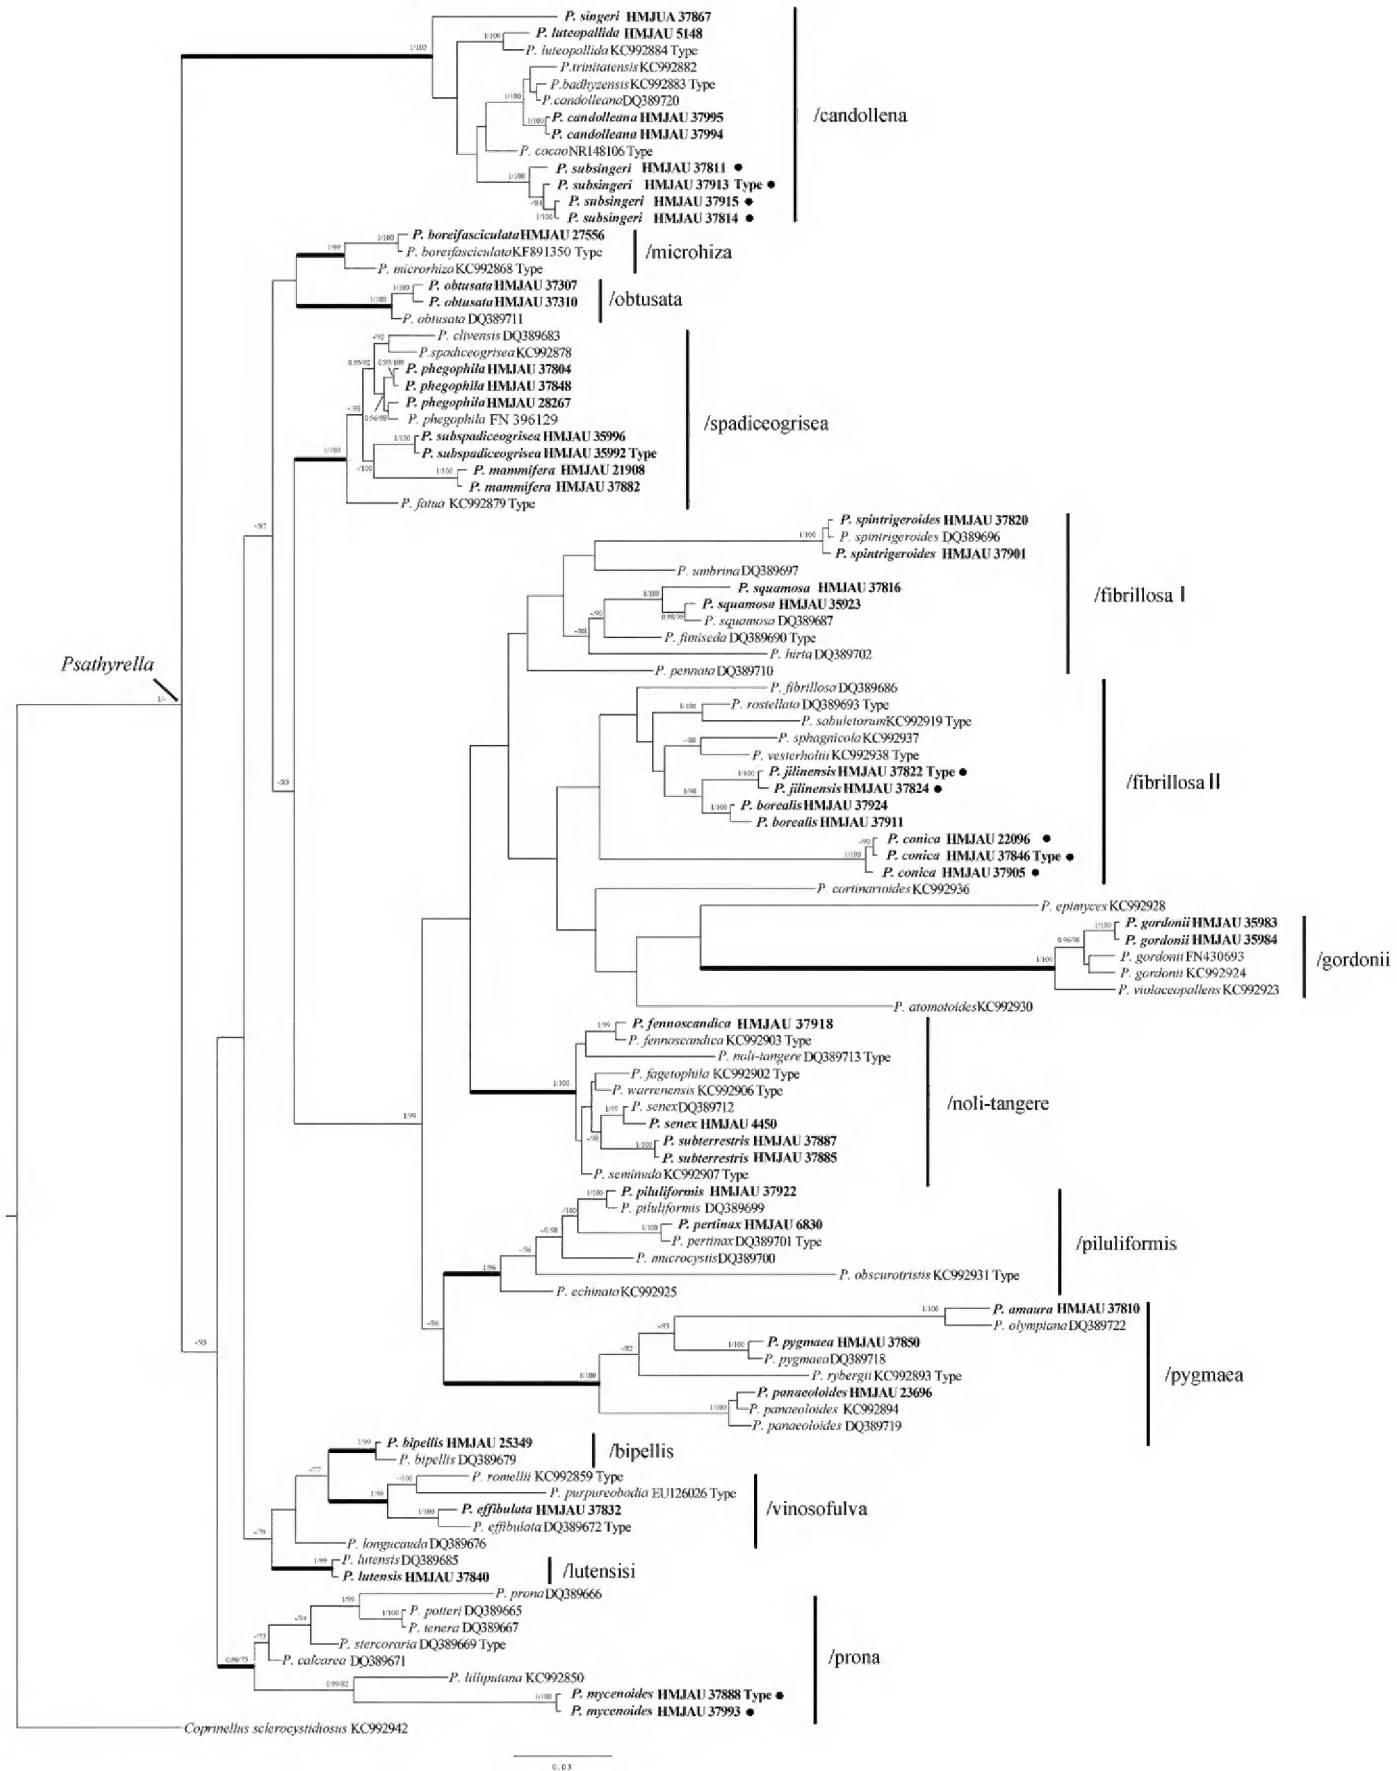

Figure 1. Bayesian and Maximum Likelihood tree inferred from partial ITS sequence data (BPP \geq 0.95, Bootstrap \geq 75 are indicated). The tree is rooted with *Coprinellus sclerocystidiosus* (M. Lange & A.H. Sm.) Vilgalys, Hopple & Jacq. Johnson. Newly generated sequences appear in bold. ● indicates newly described species.

The positions of some species are firstly supplemented: *P. amaura* belongs to /pygmaea and is very close to *P. olympiana* A.H. Sm.; *P. borealis* belongs to /fibrillosa II. *P. mammifera* belongs to /spadiceogrisea; *P. singeri* A.H. Sm. belongs to /candolleana; and *P. subterrestris* belongs to /noli-tangere.

Taxonomy

Psathyrella conica T. Bau & J.Q. Yan, sp. nov.

MycoBank: MB823858

Figs 2a–b, 3

Diagnosis. Pileus campanulate to conical, with a subacute to obtuse umbo in early stage. Lamellae 3.0–5.0 mm broad, close. Basidiospores $7.8\text{--}8.8 \times 4.0\text{--}4.5\text{--}5.0$ μm , germ pore indistinct or absent. Pleurocystidia numerous, narrowly utriform, with obtuse to broad obtuse or slightly subcapitate at apex. Cheilocystidia scattered.

Holotype. CHINA. Jilin Province, Yanbian Korean Autonomous Prefecture, Antu County, Changbai Mountain, 30 Jun 2017, HMJAU 37846.

Etymology. Name refers to the conical pileus.

Description. Pileus 12–45 mm, campanulate to conical, with a subacute to obtuse umbo in early stage, hygrophanous, chestnut (7D4–7D6), becoming dirty white with slightly yellowish-brown (6C5–6C6) as drying, striate indistinctly. Veil with a thin coating of white to dirty white (6A1–6B1) fibrils, evanescent. Context dirty white with slightly pink (6B4–6B5), about 3.0 mm thick at stipe centre. Lamellae 3.0–5.0 mm broad, close, adnate to slightly adnexed, coffee-cream (6C4–6C6); edges white (6A1), saw-toothed under $20\times$ magnifier. Stipe 34–85 \times 2.0–7.0 mm, cylindrical, slightly

expanded or not at base, white, with slightly brown at base, hollow, equal, surface covered with white (6A1) fibrils in early stage, evanescent. Odour and taste indistinctive.

Basidiospores $7.8\text{--}8.8 \times 4.0\text{--}4.5\text{--}5.0$ µm, $Q=1.8\text{--}2.1\text{--}2.3$, oblong-ellipsoid to oblong, in profile slightly flattened on one side, pale yellowish-brown in water, yellowish-brown to brown in 5% potassium hydroxide (KOH), inamyloid, smooth, with 1–2 guttulate, germ pore indistinct or absent. Basidia $20\text{--}25 \times 7.3\text{--}9.8$ µm, clavate, hyaline, 4- or 2-spored. Pleurocystidia $43\text{--}61 \times (8.5\text{--})9.8\text{--}12$ µm, numerous, narrowly utriform, thin-walled, hyaline, with obtuse to broad obtuse or slightly subcapitate, sometimes adhering subhyaline deposits. Cheilocystidia scattered, similar to pleurocystidia, $24\text{--}39 \times 8.5\text{--}12$ µm; spheropedunculate or clavate cells abundant, $20\text{--}29 \times$

12–18 μm . Trama of gills irregular, up to 20 μm broad. Pileipellis consisting of 2–3 cells deep layer of subglobose cell, 25–37 μm broad. Clamps present.

Habit and habitat. Solitary to scattered on rotten wood or humus in mixed forests.

Other specimens examined. Jilin Province, Baishan City, Fusong County, Lushuihe town, 7 Jul 2004, HMJAU 4969; 29 Jun 2005, HMJAU 4923; 25 Jun 2009, HMJAU 22096; Yanbian Korean Autonomous Prefecture, Antu County, Changbai Mountain, 23 Jun 2012, HMJAU 25342; 4 Jul 2015, HMJAU 37826; 29 Jun 2017, HMJAU 37847, HMJAU 37904; 6 Aug 2017, HMJAU 37905.

***Psathyrella jilinensis* T. Bau & J.Q. Yan, sp. nov.**

MycoBank: MB823856

Figs 2c–e, 4

Diagnosis. Pileus paraboloid to convex, margin at first appendiculate with adhering patches of white evanescent inner veil. Lamellae 2.0–5.0 mm broad, moderately close. Basidiospores (5.8–)6.3–7.3(–7.8) \times (2.9–)3.4–4.4 μm , germ pore absent or indistinct. Pleurocystidia fusiform to narrowly fusiform. Cheilocystidia similar to pleurocystidia. Cheilocystidia and pleurocystidia covered by hyaline, hemispherical amorphous incrustation at apex.

Holotype. CHINA. Jilin Province: Changbai Mountain, Antu County, Yanbian Korean Autonomous Prefecture, 42°23'51"N, 126°05'47"E, 760 m alt., 7 Jul 2015, HMJAU 37822.

Etymology. Name refers to the type locality where the new species was collected.

Description. Pileus 17–45 mm, paraboloid to convex, hygrophanous, reddish-brown (8E5–8E6) at centre, pale yellowish-brown (7C6–7D7) at margin in early stage, yellowish-brown (6B5–6C5), striate up to 1/2 from margin at maturity, becoming slightly brown (7C5–7D6) as pileus dries. Veil white (6A1), thin, fibrillose, at first as appendiculate inner veil or adhering patches at pileus margin, evanescent. Context white (6A1), thin, very fragile, about 2.0 mm thick at centre. Lamellae 2.0–5.0 mm broad, moderately close, adnate, greyish to greyish-brown (7C1–7C3); edges saw-toothed under 20 \times magnification. Stipe 40–50 \times 3.0–7.0 mm, white (6A1), cylindrical, hollow, surface covered with slight white (6A1) evanescent fibrils. Odour and taste indistinctive.

Basidiospores (5.8–)6.3–7.3(–7.8) \times (2.9–)3.4–4.4 μm , $Q = (1.4\text{--})1.8\text{--}2.0\text{--}(2.3)$, oblong-ellipsoid, in profile flattened on one side, pale brown in water, brown in 5% KOH, gradually becoming greyish-brown, inamyloid, smooth, germ pore absent or indistinct, about 0.9 μm wide (if it can be observed). Basidia 15–17 \times 6.0–7.0 μm , clavate, hyaline, 4 or 2-spored. Pleurocystidia fusiform, narrowly fusiform, rarely narrowly utriform, thin-walled or slightly thick-walled, apex obtuse to subacute, hyaline, covered by hyaline, hemispherical amorphous incrustation, which can dissolve in 5% KOH. Cheilocystidia 37–51 \times 8.5–12 μm , similar to pleurocystidia, hyaline, covered

with amorphous incrustation at apex. Trama of gills parallel to hyphae, up to 15 µm broad. Pileipellis consisting of 2–3 cells deep layer of subglobose cell, 20–30 µm broad. Veil composed of cylindrical hyphae, 8.5–10 µm broad. Clamps present.

Habit and habitat. Solitary to scattered on rotten wood or humus in mixed forests.

Other specimens examined. Jilin Province, Baishan City, Fusong County, Lushuhe town, 27 Jun 2009, HMJAU 22099; 9 Jul 2015, HMJAU 37823; Yanbian Korean Autonomous Prefecture, Antu County, Changbai Mountain, 23 Jun 2012, HMJAU 25351; 31 Aug 2012, HMJAU 25351; Dayangcha, 6 Jul 2015, HMJAU 37824.

***Psathyrella mycenoides* T. Bau, sp. nov.**

MycoBank: MB823857

Figs 2f, 5

Diagnosis. Pileus 4.0–5.0 mm, hemispherical to convex. Stipe slender. Basidiospores $8.8\text{--}9.2\text{--}(9.7) \times 4.9\text{--}5.4 \mu\text{m}$, germ pore distinct, but small. Pleurocystidia scattered, fusiform to lageniform with an obtuse apex. Cheilocystidia lageniform, with an obtuse apex or clavate to spheropedunculate with a long or short mucronate apex.

Holotype. CHINA. Jilin Province, Changchun City, Jilin Agricultural University, $43^{\circ}48'36''\text{N}$, $125^{\circ}24'25''\text{E}$, 220 m alt., 10 Sep 2016, HMJAU 37888.

Etymology. Name refers to its macroscopic characteristics similar to *Mycena*.

Description. Pileus 4.0–5.0 mm, hemispherical to convex, dirty white with pinkish (7A4–7B5), hygrophanous, striate up to centre from margin. Veil not observed. Context very thin and very fragile, about 0.5 mm thick at stipe centre. Lamellae 1.5–2.0 mm broad, adnate to slightly adnexed, pale brown (7C3–7C4), edges saw-toothed under $20\times$ magnification. Stipe slender, $25\text{--}30 \times 0.5\text{--}1.0 \text{ mm}$, hygrophanous, subhyaline, cylindrical, hollow, equal, fragile, evanescently pruinose at apex.

Basidiospores $8.8\text{--}9.2\text{--}(9.7) \times 4.9\text{--}5.4 \mu\text{m}$, $Q=1.6\text{--}2.0$, ellipsoid to oblong-ellipsoid, in profile flattened on one side, pale yellowish-brown in water, becoming dark grey to dark brown in 5% KOH, germ pore distinct, but small, about $0.9 \mu\text{m}$ broad. Basidia $15\text{--}17 \times 8.8\text{--}10 \mu\text{m}$, clavate, hyaline, 4- or 2-spored. Pleurocystidia $37\text{--}56 \times 12\text{--}17 \mu\text{m}$, scattered, fusiform to lageniform with an obtuse apex, thin-walled and hyaline. Cheilocystidia numerous, $29\text{--}44 \times 9.8\text{--}17 \mu\text{m}$, hyaline, lageniform with an obtuse apex or clavate to spheropedunculate, with long or short mucronate apex, rarely spheropedunculate. Trama of gills irregular, hyphae up to $10 \mu\text{m}$ broad. Pileipellis hymeniderm, cells $20\text{--}30 \mu\text{m}$ broad. Clamps present.

Habit and habitat. Solitary to scattered on humus in mixed forests.

Other specimens examined. CHINA. Jilin Province, Changchun City, Jilin Agricultural University, 12 Sep 2016, HMJAU 37993.

***Psathyrella subsingeri* T. Bau & J.Q. Yan, sp. nov.**

MycoBank: MB823855

Figs 2g–i, 6

Diagnosis. Pileus 15–40 mm, paraboloid to conical. Lamellae 2.0–4.0 mm broad, close. Basidiospores $5.8\text{--}7.8\text{--}(8.8) \times 3.9\text{--}4.4\text{--}(5.0) \mu\text{m}$, very pale, nearly hyaline or slightly yellow in water and 5% KOH. Germ pore absent. Pleurocystidia absent. Cheilocystidia utriform to predominantly spheropedunculate.

Holotype. CHINA. Jilin Province, Changchun City, Jingyuetan National Scenic Area, $43^{\circ}47'38''\text{N}$, $125^{\circ}26'55''\text{E}$, 200 m alt., 25 Jun 2017, HMJAU 37913.

Etymology. Name refers to its microscopic characteristics similar to *P. singeri*.

Figure 5. Microscopic features of *Psathyrella mycenoides* (HMJAU 37888). **a** Basidiomata **b** Basidiospores **c** Basidia **d** Pileipellis **e** Pleurocystidia **f** Cheilocystidia. Bars: 10mm (**a**); 10µm (**d–f**). Drawing by Jun-Qing Yan.

Description. Pileus 15–40 mm, paraboloid to conical, obtuse or slightly umbonate at disc, hygrophanous, dark reddish-brown (8E7–8F8) or faint yellowish-brown (5C5–5C4), becoming yellowish-brown (6D5–6D6) as pileus dries, striate indistinct. Veil present in early stage, thin, white (6A1), fibrillose, evanescent. Context white (6A1), thin and very fragile, about 2.5 mm thick at stipe centre. Lamellae 2.0–4.0 mm broad, close, adnate, pale brown (6C4–6C5), edges white (6A1), saw-toothed under

Discussion

These phylogenetic results are very much in congruence with the study of Larsson and Örstadius (2008) and Örstadius et al. (2015), except */fibrillosa*, which separates to two lineages (*/fibrillosa* I and */fibrillosa* II). As only ITS sequences were analysed in this study, this accounts for the difference and the very low support value (BPP<0.3). Four new species are separated into individual lineages (BPP=1) and distinct from other closely related taxa.

Psathyrella conica is a distinct lineage in *fibrillosa* II, which is independent from any other related taxa. Morphologically, it can be classified in subsection *Spadiceogriseae* (Kits van Waveren 1985). Only *P. clivensis* (Berk. & Broome) P. D. Orton does not have a germ pore in this subsection, but basidiospores of *P. clivensis* are obviously broader, 8–10 × 5.5–6.5 µm and ellipsoid to ovoid (Kits van Waveren 1985). It can also be classified in section *Fatuae* (Smith 1972), some species having sturdy stipe and utriform cystidia, but they can be clearly distinguished from *P. conica* by other micro-morphology. *Psathyrella acadiensis* A.H. Sm. has smaller basidiospores, which are only up to 6.0 µm long; *P. albocinerascens* A.H. Sm. has an obvious germ pore and white pileus in the early stage; *P. amarella* A.H. Sm. and *P. spadiceogrisea* (Schaeff.) Maire have an obvious germ pore; *P. vesiculocystis* A.H. Sm. has pedicellate-pleurocystidia (Smith 1972). Furthermore, *P. terrestris* Natarajan has aspects of *P. conica*, whose pileus is umbonate, but it has broadly utriform pleurocystidia and its basidiospores are dark brown, subglobose and up to 8.5 µm broad (Natarajan 1978).

Psathyrella jilinensis grouped together with *P. borealis* in */fibrillosa* II. However, *P. borealis* has an obvious germ pore. Morphologically, it can be classified in section *Hydrophilae* by basidiospores rarely exceeding 7.5 µm and the presence of pleurocystidia. There are hardly any other species in the section that match the characteristics of *P. jilinensis*. The pleurocystidia of *P. atomatoides* (Peck) A.H. Sm. do not have amorphous incrustation. Basidiospores of *P. cortinarioides* P.D. Orton and *P. pertinax* have a clearly truncated base. Cystidia of *P. umbrina* Kits van Wav. have subacute apex and their basidiospores are broader, up to 4.5–5.5 µm (Kits van Waveren 1985; Örstadius and Kundsén 2012). Furthermore, *P. cokeri* (Murrill) A.H. Sm., *P. pennata* and *P. subsimilissima* A.H. Sm. have some similar aspects of *P. jilinensis*, but *P. cokeri* (Murrill) A.H. Sm. and *P. subsimilissima* A.H. Sm. do not have amorphous incrustation (Smith 1972) and *P. pennata* grows on burnt soil, its basidiospores being larger and narrowly amygdaloid (Örstadius and Kundsén 2012).

Psathyrella mycenoides belongs to /prona and is placed close to *P. lilliputana*. However *P. lilliputana* has larger (9.5–11 × 5.0–6.0 µm) and snout-like basidiospores (Örstadius et al. 2015). Morphologically, more than 10 species of *Psathyrella* have very small basidiomata, whose pileus rarely exceeds 10 mm, but they can be separated by obvious characteristics as follows: *P. byssina* (Murrill) A.H. Sm. and *P. scheppingensis* Arnolds have smaller basidiospores, which rarely exceed 7.5 µm (Smith 1972; Arnolds 2003); *P. coprinoides* A. Delannoy, Chiaffi, Courtec. & Eyssart. and *P. tenuicula* (P. Karst.) Örstadius & Huhtinen have pileocystidia and slender basidiospores (Örstadius and Huhtinen 1996; Delannoy et al. 2002); the coprophilous fungi of *P. granulose* Arnolds have utriform cystidia (Arnolds 2003); basidiospores of *P. liciosae* Contu & Pacioni are partly phaseoliform in side view and ochraceous-brown in 5% KOH (Contu and Pacioni 1998); *P. minima* Peck has very distant lamellae (Peck 1878); and basidiospores of *P. psilocyboides* A.H. Sm. are truncated at the base (Smith 1972).

Psathyrella subsingeri belongs to /candollena. Only *P. luteopallida* and *P. singeri* have nearly hyaline basidiospores pores in this clade. However, the basidiospores of *P. luteopallida* are longer than 8.0 µm. The basidiospores of *P. singeri* are broader, up to 5.5 µm (Smith 1972). Morphologically, *P. subsingeri* belongs to section *Spintrigerae* with basidiospores less than 9.0 µm and absent pleurocystidia (Kits van Waveren 1985). Its cheilocystidium is similar to *P. submicrospora* Heykoop & G. Moreno [= *Coprinopsis submicrospora* (Heykoop & G. Moreno) Örstadius & E. Larss.], but basidiospores of *P. submicrospora* are predominantly amygdaliform (Heykoop and Moreno 2002). It also can be classified in series *Atricastaneae* (Smith 1972). There are only three species in the series that match the characteristic of subhyaline to hyaline basidiospores in water or 5% KOH. However, they can be separated as follows: the basidiospores of *P. atricastanea* (Murrill) A.H. Sm are truncate; *P. albipes* A.H. Sm. and *P. subhyalinispora* (Murrill) A.H. Sm. differ in having an obvious germ pore (Smith 1972). Furthermore, *P. aequatoria* Singer has subhyaline to hyaline basidiospores, but differs by smaller and sometimes papillate pileus. *Psathyrella olympiana* and *P. bipellis* [= *P. odorata* (Peck) Sacc.] have aspects of *P. subsingeri* in macroscopic characteristics, whose pileus are reddish-brown, but have pleurocystidia (Örstadius and Kundsén 2012).

Key to species of *Psathyrella* in Northeast China

- | | | |
|---|--|------------------------|
| 1 | Pleurocystidia absent..... | 2 |
| – | Pleurocystidia present | 5 |
| 2 | Basidiospores brown in 5% KOH..... | <i>P. candolleana</i> |
| – | Basidiospores very pale, subhyaline in 5% KOH | 3 |
| 3 | Basidiospores predominantly longer than 8.0 µm | <i>P. luteopallida</i> |
| – | Basidiospores shorter | 4 |
| 4 | Basidiospores up to 5.5 µm broad..... | <i>P. singeri</i> |
| – | Basidiospores up to 4.5 µm broad..... | <i>P. subsingeri</i> |

- 5 Basidiospores longer than 10 μm , pleurocystidia utriform to clavate, sometimes with yellowish-brown inclusions.....*P. bipellis*
 – Not as above 6
- 6 Germ pore always or predominantly distinctly visible 7
 – Germ pore absent or predominantly indistinctly visible 19
- 7 Pleurocystidia rarely, lageniform, shorter than 40 μm , clamps absent...*P. effibulata*
 – Not as above 8
- 8 Basidiospores up to 7.0 μm long..... 9
 – Basidiospores longer..... 10
- 9 Pleurocystidia up to 35 μm long, mostly with distinct crystals *P. pygmaea*
 – Pleurocystidia up to 65 μm long, without crystals..... *P. piluliformis*
- 10 Basidiomata densely caespitose, cheilocystidia fusiform or mucronate, basidiospores 8.5–9.8 \times 4.6–5.1 μm *P. boreifasciculata*
 – Not as above 11
- 11 Pleurocystidia mostly fusiform or lageniform 12
 – Pleurocystidia mostly utriform, narrowly utriform or clavate 14
- 12 Basidiomata vary small, pileus up to 5.0 mm, cheilocystidia with long or short mucronate..... *P. mycenoides*
 – Not as above 13
- 13 Grown on sphagnum, basidiospores 8.8–9.2 \times 4.4–5.0 μm *P. borealis*
 – Terrestrial or basidiomata attached to bits of woody debris, basidiospores 7.3–8.8 \times 4.1–4.4 μm *P. subterrestris*
- 14 Basidiospores distinctly triangular..... *P. panaeoloides*
 – Not as above 15
- 15 Pleurocystidia often with in ammonia greenish deposits, basidiospores 8.8–9.7 \times 4.4–4.9 μm *P. lutensis*
 – Not as above 16
- 16 Cheilocystidia clavate to spheropedunculate, pleurocystidioid cheilocystidia scattered..... *P. phlegophila*
 – Pleurocystidioid cheilocystidia numerous..... 17
- 17 Basidiospores up to 6.0 μm broad..... *P. fennoscandica*
 – Basidiospores up to 5.0 μm broad..... 18
- 18 Veil strongly developed and flocculose, pleurocystidia utriform or clavate.....
 *P. gordonii*
 – eil with a thin coating of fibrils, pleurocystidia narrowly utriform *P. senex*
- 19 Pleurocystidia distinctly thick-walled or slightly thick-walled, covered with distinct crystals, basidiospores up to 9 μm long..... 20
 – Not as above 21
- 20 Pleurocystidia utriform, distinctly thick-walled..... *P. amaura*
 – Pleurocystidia fusiform, slightly thick-walled or thin-walled *P. jilinensis*
- 21 Pleurocystidia fusiform, lageniform, with obtuse or subacute apex..... 22
 – Pleurocystidia utriform, narrowly utriform, with obtuse to broad obtuse apex 25

- 22 Cheilocystidia mucronate, basidiospores ellipsoid, pale brown in 5% KOH..... *P. obtusata*
 *P. obtusata*
 – Not as above23
 23 Basidiospores (6.8–)7.3–7.8(–8.8) × 3.4–4.9 µm, base often broadly truncate, in profile often phaseoliform..... *P. pertinax*
 – Not as above24
 24 Basidiospores oblong to oblong-ellipsoid, pleurocystidia thin-walled *P. squamosa*
 *P. squamosa*
 – Basidiospores ellipsoid, pleurocystidia slightly thick-walled.... *P. spintrigeroides*
 25 Basidiospores reddish-brown in water *P. mammiifera*
 – Basidiospores yellowish-brown or pale yellowish-brown in water26
 26 Pileus often with subacute or obtuse umbo, basidiospores 7.8–8.8 × 4.0–4.5(–5.0) µm, oblong to oblong-ellipsoid *P. conica*
 – Pileus without umbo, basidiospores 6.8–7.8 × 3.9–4.9 µm, ellipsoid, rarely oval..... *P. subspadiceogrisea*

Acknowledgments

This work is supported by the 111 Project (grant numbers D17014) and the Ministry of Education Innovation Team (grant numbers IRT1134 and IRT-15R25). We sincerely thank Mr. Bai Wang (Changbai Mountain Academy of Sciences, Jilin, China) for his kind help during field work.
